1. $\mathrm{C} .15 .25 \mathrm{~g} \mathrm{Mg}(1 \mathrm{~mol} \mathrm{Mg} / 24.3 \mathrm{~g})(1 \mathrm{~mol}$ dypingite $/ 5 \mathrm{~mol} \mathrm{Mg})(485.65 \mathrm{~g} / 1 \mathrm{~mol}$ dypingite) $=60.95 \mathrm{~g}$
2. D. $(89.9043)^{*}(.05146)+(90.9053) *(0.1123)+(91.9046)^{*}(0.1711)+(93.9061)^{*}$ $(0.1740)+(95.9082) *(0.280)=91.23=\mathrm{Zr}$
3. D. $(0.02597 \mathrm{~L})(3.52 \mathrm{~mol}$ sugar $/ \mathrm{L})+(0.05589 \mathrm{~L})(6.85 \mathrm{~mol}$ sugar $/ \mathrm{L})=0.474$ mol sugar. Divide by the total volume $0.474 \mathrm{~mol} / .08186 \mathrm{~L}=5.79 \mathrm{M}$
4. E. $\mathrm{CaF}_{2}$ dissolves to give $\mathrm{Ca}^{2+}(\mathrm{aq})$ and $\mathrm{F}^{-}(\mathrm{aq})$. The fluoride anion is a weak base and will therefore react with HCl causing a decrease in fluoride ion concentration. As per Le Chatelier's principle this will then drive the solubility reaction $\left(\mathrm{CaF}_{2}(\mathrm{~s}) \rightarrow \mathrm{Ca}^{2+}(\mathrm{aq})+2 \mathrm{~F}^{-}(\mathrm{aq})\right)$ to the right
5. A. In (A) the correct representation of the $\mathrm{SO}_{3}$ molecules is used as well as the correct consideration of limiting reagents. Option (C) involves the creation of some oxygen atoms. Options (B) and (D) show the coefficient on the $\mathrm{SO}_{3}$ as representing the $2 \mathrm{SO}_{3}$ molecules are actually bound together and not that it is the lowest whole number ratio.
6. B. First calculate the theoretical mass of $\mathrm{PCl}_{5}$ produced:
$=61.3 \mathrm{~g} \mathrm{Cl}_{2}\left[1 \mathrm{~mol} \mathrm{Cl}_{2} / 70.91 \mathrm{~g} \mathrm{Cl}_{2}\right]\left[1 \mathrm{~mol} \mathrm{PCl}_{5} / 1 \mathrm{~mol} \mathrm{Cl}_{2}\right]\left[208.2 \mathrm{~g} \mathrm{PCl}_{5} / 1 \mathrm{~mol} \mathrm{PCl}_{5}\right]$ $=180.0 \mathrm{~g}$
Theoretical yield $=[119.3 / 180.0] \times 100=66.3 \%$
7. D. The oxidation numbers of the reactants and products do not change, so it cannot be a redox reaction.
8. D. Use $\mathrm{PV}=\mathrm{nRT}$ to solve for moles.

$$
\begin{aligned}
&(1 \mathrm{~atm})(1 \mathrm{~L})=n(0.0821)(300 \mathrm{~K}) \\
& \mathrm{n}=0.0406 \mathrm{~mol} \\
& M W=1.79 \mathrm{~g} / 0.0406 \mathrm{~mol}=44.1 . \text { This corresponds to } D\left(\mathrm{C}_{3} \mathrm{H}_{8}\right)
\end{aligned}
$$

9. D. The graph for D should show an upward (positive) linear slope for Boyle's Law.
10. E. Only E is a constitutional isomer. All the others are conformers.
11. C. Bond formation is an exothermic process.
12. D. In this temperature range, water will boil so the entropy change will be the greatest.
13. D. The value of A changes by 32 which would take 8 alpha particles. The net change in Z is 10 therefore 6 beta particles are needed to balance.
14. A. $\quad 1.000 \mathrm{~g} \mathrm{x}(1 \mathrm{~mol} \mathrm{O} / 16.00 \mathrm{~g} \mathrm{O})=0.06250 \mathrm{~mol} \mathrm{O}$ $\mathrm{mol} \mathrm{M}=0.06250 \mathrm{~mol} \mathrm{Ox}(1 \mathrm{~mol} \mathrm{M} / 3 \mathrm{~mol} \mathrm{0})=0.02083 \mathrm{~mol} \mathrm{M}$ molar mass $\mathrm{M}=1.083 \mathrm{~g} / 0.02083 \mathrm{~mol} \mathrm{M}=51.99 \mathrm{~g} / \mathrm{mol}(\mathrm{Cr})$
15. D. Given that the photons have energy greater than the threshold frequency they will be able to remove electrons. Einstein explained that each photon removes one electron.
16. A. 28 is the number of electrons that would be found in $n$ levels 1,2 , and 3 .
17. C. The answer is C .
18. C. Hydrogen cannot hybridize.
19. B. Calculate hours $=1 \times 10^{3} \mathrm{~kg} \mathrm{Na}[1000 \mathrm{~g} / 1 \mathrm{~kg}][1 \mathrm{~mol} \mathrm{Na} / 22.99 \mathrm{~g} \mathrm{Na}][1 \mathrm{~mol}$ $\mathrm{e} / 1 \mathrm{~mol} \mathrm{Na}][96485 \mathrm{C} / 1 \mathrm{~mole}]\left[1 \mathrm{~s} / 3.00 \times 10^{4} \mathrm{C}\right][1 \mathrm{~min} / 60 \mathrm{~s}][1 \mathrm{hr} / 60 \mathrm{~min}]=$. 38.9 hours.
20. B. In examining trials 1 and 3 , the rate doubles when [B] doubles, therefore the reaction is first order in $B$. In examining trials 1 and 2 , when [A] doubles, the rate increases by a factor of 4 . Therefore the reaction is second order in $A$.
21. B. The units of the rate constant indicate a $4^{\text {th }}$ order reaction. The sum of the exponents in the rate law must equal the order. The reaction must be $2^{\text {nd }}$ order in $\mathrm{H}^{+}$.
22. D. A weak base would have a relatively low pH before any acid is added and should have a pH that is less than 7 at the equivalence point. As it is being titrated with a strong acid the final pH will be very low.
23. C. The i value for $\mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}$ is 3 and is 2 for NaBr . In equimolal solutions, there will be more ions present in the $\mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2}$ solution, which will both lower the vapor pressure further according to Raoult's Law and decrease the freezing point more than NaBr .
24. C. Vapor is only dependent on temperature, not the volume of liquid present.
25. E. The greater the IM forces the lower the vapor pressure. Therefore $\mathrm{Cl}_{2}$, with only Van derWaals forces will have the highest vapor pressure (and is, in fact, a gas at room temperature)
26. C. Use the integrated first-order rate law.

$$
\begin{aligned}
& \ln 0.0120=\ln (0.0200)-\left(1.06 \times 10^{-3} \mathrm{~min}^{-1}\right) t \\
& t=481 \mathrm{~min}
\end{aligned}
$$

27. C. Solve for molarity of $\mathrm{N}_{2} \mathrm{O}_{4}$ first and do an ICE table.

|  | $\mathrm{N}_{2} \mathrm{O}_{4}(\mathrm{~g})$ | $2 \mathrm{NO}_{2}(\mathrm{~g})$ | $\mathrm{K}=4.0 \times 10^{-7}$ |
| :---: | :---: | :---: | :---: |
| I | 0.20 M | 0 |  |
| C | -x | +2x |  |
| E | 0.20-x | 2 x |  |

$K=4.0 \times 10^{-7}=(2 x)^{2} / 0.20-x$. Solve for $x . x=1.4 \times 10^{-4} M$
Therefore $\left[\mathrm{NO}_{2}\right]=2\left(1.4 \times 10^{-4}\right)$
28. C. $\Delta H=$ sum of the B.E. of the reactants - sum of the B.E. of the products.

$$
\begin{aligned}
& x=[(1 \mathrm{~mol}(945 \mathrm{~kJ} / \mathrm{mol})+(3 \mathrm{~mol})(432 \mathrm{~kJ} / \mathrm{mol})]-[(6 \mathrm{~mol})(391 \\
& \mathrm{kJ} / \mathrm{mol})]
\end{aligned}
$$

29. C. According to periodic trends for the alkali and alkali earth metals (which generally form cations), the answer is C. For an element to favorably form a cation it must cost little energy to form (low ionization energy) and be unfavorable to form the anion (positive, or just slightly negative electron affinities)
30. B. The one with the lowest molecular weight will have the highest number of molecules in a 1 g sample.
31. $B$. $M=[20.2 \mathrm{~g} \mathrm{HCl} / 100 \mathrm{~g}$ soln $][1.096 \mathrm{~g}$ soln $/ 1 \mathrm{~mL}$ soln $][[1 \mathrm{~mol} \mathrm{HCl} / 36.45 \mathrm{~g}$ $\mathrm{HCl}][1000 \mathrm{~mL} / 1 \mathrm{~L}]=6.07 \mathrm{M}$
32. C. Mol of base $=0.0009 \mathrm{~mol}$. Mol of acid $=0.0018 \mathrm{~mol}$. There is a $1: 2$ ratio from base to acid. Since it takes twice as many moles of acid to titrate the base, there must be two $\mathrm{OH}^{-}$ions for each mole of base.
33. A. $\mathrm{SeF}_{4}$ is VSEPR shape $\mathrm{AX}_{4} \mathrm{E}$, which has a molecular shape of see-saw. This is a trigonal bipyramidal electronic geometry but due to the lone pair on the central atom a see-saw molecular shape.
34. D. The one with the highest temperature has the highest average kinetic energy.
35. A. The answer is A according to periodic trends. (size decreases up and to the right on the periodic table) Remember that cations cause a decrease in size and anions an increase relative to their parent atoms.
36. D. Use Hess' Law. Switch the first equation and therefore change the sign to 67.7 kJ and then add to 9.7 kJ , as the second equation remains in the order provided.
37. D. Do a $Q$ test first. $Q=(2)^{3}(6) /(5)^{3}=0.384$. $Q>K$, so the equilibrium will shift to the left.
38. C. If the volume is reduced, the equilibrium will shift to the side that has fewer moles of gas. The reactant side has 3 moles and the product side has 4 .
39. E. Only E contains a polyatomic ion. There are covalent bonds between C and N in the polyatomic ion and there is an ionic bond between $\mathrm{Na}^{+}$and $\mathrm{CN}^{-}$.
40. B. Only statement II is true. (note that the lone pairs on oxygen have not been drawn but must be included to correctly determine the validity of statement IV)
