Efficiency

Extension

An application

"He studied and nearly mastered the Six-books of Euclid (geometry) since he was a member of Congress. He began a course of rigid mental discipline with the intent to improve his faculties, especially his powers of logic and language. Hence his fondness for Euclid, which he carried with him on the circuit till he could demonstrate with ease all the propositions in the six books; often studying far into the night, with a candle near his pillow, while his fellow-lawyers, half a dozen in a room, filled the air with interminable snoring."

—Lincoln's law partner, William Herndon

Efficiency

Extension

An application

- ▶ Number theory is the study of the integers
- ▶ Euclid introduced concepts of number theory:
 - ▶ whole number
 - ▶ prime number
 - ▶ composite number
 - ▶ perfect number
(e.g., $6 = 1 + 2 + 3$, $28 = 1 + 2 + 4 + 7 + 14$)
- ▶ Major results
 - ▶ **Method to find the greatest common divisor of two whole numbers**
 - ▶ Whole numbers can be uniquely factored into primes
(e.g., $1035 = 3 \cdot 3 \cdot 5 \cdot 23$ and this is unique)
 - ▶ There are an infinite number of primes
 - ▶ If $2^p - 1$ is prime, then $2^{p-1}(2^p - 1)$ is perfect
(e.g., for $p = 3$, $2^3 - 1$ is prime and so $2^2(2^3 - 1) = 28$ is perfect)

Efficiency

Extension

An application

- ▶ Given two positive whole numbers, say 1035 and 759
- ▶ We are looking for a **common** divisor (measure)
 - ▶ $1035 = 3 \cdot 345$ and $759 = 3 \cdot 253$ so 3 is a common divisor
 - ▶ $1035 = 23 \cdot 45$ and $759 = 23 \cdot 33$ so 23 is a common divisor
- ▶ We want the **greatest** common divisor, however. Is it 23?
- ▶ No.
 $1035 = 69 \cdot 15$ and $759 = 69 \cdot 11$, so 69 is a common divisor.
Is it the greatest common divisor?

Greatest Common Divisor (Measure)

- ▶ Given two positive whole numbers, say 1035 and 759
- ▶ We are looking for a **common** divisor (measure)
 - ▶ $1035 = 3 \cdot 345$ and $759 = 3 \cdot 253$ so 3 is a common divisor
 - ▶ $1035 = 23 \cdot 45$ and $759 = 23 \cdot 33$ so 23 is a common divisor
- ▶ We want the **greatest** common divisor, however. Is it 23?
- ▶ No.
 $1035 = 69 \cdot 15$ and $759 = 69 \cdot 11$, so 69 is a common divisor.
Is it the greatest common divisor?
- ▶ Yes.
 $1035 = 3 \cdot 3 \cdot 5 \cdot 23$ and $759 = 3 \cdot 11 \cdot 23$

We want a method to determine the greatest common divisor of any pair (a, b) of whole numbers and we don't want to work "too hard."

Method 1: brute force (ignoring Euclid)

Euclid and the Greatest Common Divisor

Through the
artist's eye

Background

The Elements:
old and new

Lincoln
connection

Number theory

Bk VII, Prop. 1

**Algorithms for
gcd**

Efficiency

Extension

An application

- ▶ Let m be the smaller of a and b
- ▶ Try all candidate divisors $m, m - 1, m - 2, \dots, 1$
- ▶ For each candidate, check if it is a common divisor
- ▶ Stop when a common divisor has been found: this is the greatest one

For large values of a and b , this is very labor-intensive!
We can do much, much better.

Euclid's (simplified) rule

Suppose x and y are positive integers with $x \geq y$. Then
 $\gcd(x, y) = \gcd(x - y, y)$.

Proof sketch

▶ $\gcd(x, y) \leq \gcd(x - y, y)$

▶ $\gcd(x - y, y) \leq \gcd(x, y)$

276	207	subtract: $276 - 207 = 69$
69	207	swap
207	69	subtract: $207 - 69 = 138$
138	69	subtract: $138 - 69 = 69$

Method 2: repeated subtraction

Euclid's simplified rule: if $x \geq y$ then $\gcd(x, y) = \gcd(x - y, y)$

x	y	action
1035	759	subtract: $1035 - 759 = 276$
276	759	swap
759	276	subtract: $759 - 276 = 483$
483	276	subtract: $483 - 276 = 207$
207	276	swap
276	207	subtract: $276 - 207 = 69$
69	207	swap
207	69	subtract: $207 - 69 = 138$
138	69	subtract: $138 - 69 = 69$
69	69	subtract: $69 - 69 = 0$

Method 2: repeated subtraction

Euclid's simplified rule: if $x \geq y$ then $\gcd(x, y) = \gcd(x - y, y)$

x	y	action
1035	759	subtract: $1035 - 759 = 276$
276	759	swap
759	276	subtract: $759 - 276 = 483$
483	276	subtract: $483 - 276 = 207$
207	276	swap
276	207	subtract: $276 - 207 = 69$
69	207	swap
207	69	subtract: $207 - 69 = 138$
138	69	subtract: $138 - 69 = 69$
69	69	subtract: $69 - 69 = 0$
0	69	stop: 69 is the greatest common divisor

We might call Euclid's method the granddaddy of all algorithms, because it is the oldest nontrivial algorithm that has survived to the present day.

Donald Knuth
The Art of Computer Programming

Euclid's rule

If x and y are positive integers with $x \geq y$, then
 $\gcd(x, y) = \gcd(y, x \bmod y)$.

```
public static int gcd(int x, int y)
{
    if (y == 0)
        return x;
    else
        return gcd(y, x % y);
}
```

Gabriel Lamé
1795 – 1870

(French; not Greek, not ancient!)

Lamé's theorem

To find the greatest common divisor of integers x and y using Euclid's algorithm takes at most $5k$ steps, where k is the number of digits of y .

Number theory

Bk VII, Prop. 1

Algorithms for
gcd

Efficiency

Extension

An application

In addition to finding $\gcd(x, y) = d$, we might want values a and b such that

$$ax + by = d$$

We know $\gcd(1035, 759) = 69$. In addition,

$$3 \cdot 1035 + (-4) \cdot 759 = 69$$

A small modification to Euclid's method determines these two values.

Euclid contributes to the Internet age

- ▶ Public-key cryptography: how to keep a secret, yet still communicate?
- ▶ Two players, traditionally known as “Alice” and “Bob”
- ▶ Bob:
 - ▶ chooses two large prime numbers, p and q
 - ▶ computes a **public** key that everyone can know. This key includes the product pq , but not the two primes.
 - ▶ computes a **private** key, computed with an extended version of Euclid's algorithm
- ▶ Alice:
 - ▶ encodes a message, using Bob's public key
- ▶ Bob decodes the message using his private key

Number theory, once thought to be an abstract area of mathematics without application, is anything but. **Hats off to Euclid!**
